

OIL PUMP DRIVE UPGRADE

SUPERIOR™ 825 INLINE ENGINES

Cooper offers an upgrade to the spring-loaded oil pump drive assembly for 6- and 8-cylinder Superior engines. The original factory design uses springs between the drive gear and the hub to dampen the direct drive of the oil pump. These springs may wear into the gear and hub and eventually break, damaging the entire assembly as well as allowing small metal fragments into the oil pan.

Our new Oil Pump Drive Upgrade Kit utilizes Viton cord strips in place of the springs, which not only provides equal or better dampening for the assembly, but also provides longer life and less wear and tear on the gear and hub.

Features/Benefits

- › Efficient redesign
- › Less wear and tear on gear and hub
- › Better dampening
- › Longer life
