

ROTAVATOR™ END DEACTIVATORS

FIGURE 1

ACI's innovative Rotavator™ operates by rotating the valve guard so as to displace the sealing elements from their seats. This action allows for gas back-flow (deactivating the end) when actuated.

Conventional plug and finger-type unloaders reduce effective valve flow areas during both loaded and unloaded modes. However, the patented Rotavator™ maintains **full flow area** during both modes of operation. This effectively **increases efficiency** regardless of whether a cylinder end is double-acting or single-acting.
